

## **CAN YOU TELL IF THIS CARGO SHIP IS CARRYING A CONCEALED NUCLEAR WEAPON? WE CAN.**

Terrorists, short of wanting to destroy us, want to destroy the way we live. To make us less free. And while some would argue that fighting terrorists means sacrificing some freedoms, there's now a defense system, proven in real world situations, that can detect and track terrorist threats – without disrupting the flow of commerce or our daily lives.

It's Textron's ARAM – Adaptable Radiation Area Monitor – system. Automatic and highly sensitive, ARAMs can detect small amounts of nuclear and radiological materials in numerous challenging scenarios. ARAMs can help homeland security inspectors locate and identify concealed radiological material in cargo at seaports and other fixed locations.

Best of all, ARAMs are not science fiction. They're already here, already in use. And unlike competitive products, they work. Quickly. Accurately. Consistently. As standalone units or as part of an integrated network. Textron ARAMs. Low-cost, real-time solutions that can help provide safe harbors for America and our way of life.
